plasminogen, human-tvmh (Ryplazim®)

Policy # 00801
Original Effective Date: 08/08/2022
Current Effective Date: 08/14/2023

 Applies to all products administered or underwritten by Blue Cross and Blue Shield of Louisiana and its subsidiary, HMO Louisiana, Inc. (collectively referred to as the “Company”), unless otherwise provided in the applicable contract. Medical technology is constantly evolving, and we reserve the right to review and update Medical Policy periodically.

When Services May Be Eligible for Coverage
Coverage for eligible medical treatments or procedures, drugs, devices or biological products may be provided only if:

- Benefits are available in the member’s contract/certificate, and
- Medical necessity criteria and guidelines are met.

Based on review of available data, the Company may consider the use of plasminogen, human-tvmh (Ryplazim®)‡ for the treatment of plasminogen deficiency type 1 to be eligible for coverage.**

Patient Selection Criteria
Coverage eligibility for plasminogen, human-tvmh (Ryplazim) will be considered when the following criteria are met:

- Initial (12 weeks)
  - Patient has a diagnosis of plasminogen deficiency type 1 (hypoplasminogenemia) confirmed by BOTH of the following:
    - Baseline plasminogen activity level is <45% of normal; AND
    - Patient has a documented history of lesions and symptoms consistent with congenital plasminogen deficiency; AND
  - Dose will not exceed 6.6 mg/kg body weight every 2 days
- Continuation (1 year)
  - Patient has received an initial authorization for Ryplazim; AND
  - Patient meets ONE of the following:
    - Patient has had a clinical response to Ryplazim as determined by the prescriber (e.g., resolution of active lesions, stabilization of current lesions, and prevention of new or recurrent lesions); OR
    - Patient’s trough plasminogen activity level is ≥10% (absolute change in plasminogen activity) above the baseline trough level (prior to initiating Ryplazim); AND

Policy #  00801
Original Effective Date:  08/08/2022
Current Effective Date:  08/14/2023

(Note: These specific patient selection criteria are additional Company requirements for coverage eligibility and will be denied as not medically necessary** if not met.)

- Ryplazim dose will not exceed 6.6 mg/kg body weight every 2 days.

When Services Are Considered Not Medically Necessary
Based on review of available data, the Company considers the continued use of plasminogen, human-tvmh (Ryplazim) when the patient has not responded to therapy within 12 weeks or does not have a trough plasminogen activity level ≥10% above baseline to be not medically necessary.**

When Services Are Considered Investigational
Coverage is not available for investigational medical treatments or procedures, drugs, devices or biological products.

Based on review of available data, the Company considers the use of plasminogen, human-tvmh when patient selection criteria are not met (except those denoted above as not medically necessary**) to be investigational.*

Background/Overview
Ryplazim is a plasma-derived human plasminogen that is indicated for the treatment of patients with the rare condition, plasminogen deficiency type 1. It works by increasing the level of plasminogen in the blood of patients with this deficiency in order to allow the fibrinous lesions to heal. It should be dosed intravenously as 6.6 mg/kg every 2 to 4 days and the frequency of administration should be determined based on monitoring of plasminogen activity level compared to baseline. If the desired clinical change is not achieved after 12 weeks of treatment, the plasminogen activity level should be checked to determine the cause. If the trough plasminogen activity level is ≥10% above baseline, other treatment options should be considered, in addition to Ryplazim treatment. If the trough plasminogen activity level is confirmed to be <10% above the baseline level, consideration should be given to discontinuing Ryplazim due to the possibility of neutralizing antibodies. It should be noted that the normal plasminogen level is highly variable and depends on age, sex, and external factors (such as tobacco smoking). All patients included in the pivotal trial for Ryplazim had a baseline plasminogen activity level ≤45%.

Current Effective Date:  08/14/2023

Congenital plasminogen deficiency is an ultra-rare, autosomal recessive disease affecting approximately 500 patients in the United States with a median age of first clinical manifestation being reported as approximately 10 months. Type 1 deficiency is considered “true” plasminogen deficiency and results in decreased plasminogen antigen and activity levels. Type 2 deficiency is referred to as dysplasminogenemia; plasminogen antigen levels are normal, but functional activity is reduced. Type 2 deficiency is asymptomatic and not clinically relevant. In contrast, type 1 deficiency may present with multisystem disease characterized by fibrin-rich (“woody”) pseudomembranes on mucous membranes. Ligneous conjunctivitis is the most common manifestation, which can lead to loss of vision if untreated. Additionally, 30% of patients with plasminogen deficiency type 1 present with ligneous gingivitis which can cause periodontal destruction and tooth loss. Other sites include respiratory tract, ears, female genitourinary tract, and kidneys. Lesions are often inflamed and painful, and organ function may be compromised. Lesions in the kidneys, respiratory tract, or cerebral ventricles may be life threatening. There are no other treatments FDA-approved for this condition. Surgical removal of lesions often results in accelerated lesion regrowth. Fresh frozen plasma has been used, but its use is limited by the low volume of plasminogen, risk of volume overload, and the time required for administration.

FDA or Other Governmental Regulatory Approval
U.S. Food and Drug Administration (FDA)

Ryplazim is approved for the treatment of patients with plasminogen deficiency type 1 (hypoplasminogenemia).

Rationale/Source

This medical policy was developed through consideration of peer-reviewed medical literature generally recognized by the relevant medical community, U.S. Food and Drug Administration approval status, nationally accepted standards of medical practice and accepted standards of medical practice in this community, technology evaluation centers, reference to federal regulations, other plan medical policies, and accredited national guidelines.

The efficacy of Ryplazim in pediatric and adult patients with plasminogen deficiency type 1 was evaluated in a single-arm, open-label, clinical trial. A total of 15 patients with plasminogen deficiency type 1 were enrolled. All patients had a baseline plasminogen activity level between <5% and 45% of normal, and biallelic mutations in the plasminogen (PLG) gene. The age range of these

Current Effective Date: 08/14/2023

patients was 4 to 42 years. All patients received Ryplazim at a dose of 6.6 mg/kg administered every 2 to 4 days for 48 weeks to achieve at least an increase of individual trough plasminogen activity by an absolute 10% above baseline and to treat the clinical manifestations of the disease.

Efficacy was established on the basis of overall rate of clinical success at 48 weeks which was defined as 50% of patients with visible or other measurable non-visible lesions achieving at least 50% improvement in lesion number/size, or functionality impact from baseline. All patients with any lesion at baseline had at least 50% improvement in the number/size of their lesions. Of the 32 external lesions, 25 were resolved by the end of Week 48. There were no recurrent or new external lesions in any patient through Week 48. Of the 12 assessed internal lesions, 9 were resolved by Week 48. No recurrent or new internal lesions were found in imaging in any patient through Week 48.

*Investigational – A medical treatment, procedure, drug, device, or biological product is Investigational if the effectiveness has not been clearly tested and it has not been incorporated into standard medical practice. Any determination we make that a medical treatment, procedure, drug, device, or biological product is Investigational will be based on a consideration of the following:

A. Whether the medical treatment, procedure, drug, device, or biological product can be lawfully marketed without approval of the U.S. Food and Drug Administration (FDA) and whether such approval has been granted at the time the medical treatment, procedure, drug, device, or biological product is sought to be furnished; or
plasminogen, human-tvmh (Ryplazim®)

Policy # 00801
Original Effective Date: 08/08/2022
Current Effective Date: 08/14/2023

B. Whether the medical treatment, procedure, drug, device, or biological product requires further studies or clinical trials to determine its maximum tolerated dose, toxicity, safety, effectiveness, or effectiveness as compared with the standard means of treatment or diagnosis, must improve health outcomes, according to the consensus of opinion among experts as shown by reliable evidence, including:
   1. Consultation with technology evaluation center(s);
   2. Credible scientific evidence published in peer-reviewed medical literature generally recognized by the relevant medical community; or
   3. Reference to federal regulations.

**Medically Necessary (or “Medical Necessity”) - Health care services, treatment, procedures, equipment, drugs, devices, items or supplies that a Provider, exercising prudent clinical judgment, would provide to a patient for the purpose of preventing, evaluating, diagnosing or treating an illness, injury, disease or its symptoms, and that are:
   A. In accordance with nationally accepted standards of medical practice;
   B. Clinically appropriate, in terms of type, frequency, extent, level of care, site and duration, and considered effective for the patient's illness, injury or disease; and
   C. Not primarily for the personal comfort or convenience of the patient, physician or other health care provider, and not more costly than an alternative service or sequence of services at least as likely to produce equivalent therapeutic or diagnostic results as to the diagnosis or treatment of that patient's illness, injury or disease.

For these purposes, “nationally accepted standards of medical practice” means standards that are based on credible scientific evidence published in peer-reviewed medical literature generally recognized by the relevant medical community, Physician Specialty Society recommendations and the views of Physicians practicing in relevant clinical areas and any other relevant factors.
