sapropterin dihydrochloride (Kuvan)®

Policy #  00303
Original Effective Date:  08/17/2011
Current Effective Date:  08/23/2017

Applies to all products administered or underwritten by Blue Cross and Blue Shield of Louisiana and its subsidiary, HMO Louisiana, Inc.(collectively referred to as the “Company”), unless otherwise provided in the applicable contract. Medical technology is constantly evolving, and we reserve the right to review and update Medical Policy periodically.

When Services May Be Eligible for Coverage
Coverage for eligible medical treatments or procedures, drugs, devices or biological products may be provided only if:
- Benefits are available in the member’s contract/certificate, and
- Medical necessity criteria and guidelines are met.

Based on review of available data, the Company may consider the use of sapropterin dihydrochloride (Kuvan)® for the treatment of hyperphenylalaninemia (HPA) due to tetrahydrobiopterin- (BH4-) responsive Phenylketonuria (PKU) to be eligible for coverage.

Patient Selection Criteria
Coverage eligibility for the use of sapropterin dihydrochloride (Kuvan) for the treatment of hyperphenylalaninemia (HPA) will be considered when both of the following criteria are met:
- Patient has diagnosis of hyperphenylalaninemia (HPA) due to tetrahydrobiopterin- (BH4-) phenylketonuria (PKU); and
- Patient is on a phenylalanine (Phe) restricted diet.

When Services Are Considered Investigational
Coverage is not available for investigational medical treatments or procedures, drugs, devices or biological products.

Based on review of available data, the Company considers the use of sapropterin dihydrochloride (Kuvan) when patient selection criteria are not met to be investigational.*

Background/Overview
Kuvan is a synthetic preparation of naturally occurring BH4, which is a cofactor for the enzyme phenylalanine hydroxylase (PAH). PAH hydroxylates Phe through an oxidative reaction to form tyrosine. In patients with PKU, PAH activity is deficient or absent. Treatment with BH4 can activate residual PAH enzyme, improve the normal oxidative metabolism of Phe, and decrease Phe levels in some patients. In patients with PKU who are responsive to treatment, blood Phe levels decrease within 24 hours after administration, although maximal effect on Phe levels may take up to one month. In 8-day and 6-week pivotal trials, response to Kuvan treatment was defined as ≥ 30% decrease in blood Phe concentration from baseline. However, in some cases (e.g., patients with mild HPA, neonates or children < 4 years of age, or pregnant women), a 20% reduction in blood Phe concentration may be sufficient. Kuvan is supplied as 100mg tablets. The recommended starting dose of Kuvan is 10mg/kg/day taken once daily. Doses of Kuvan may be adjusted in the range of 5-20mg/kg taken once daily. Doses of Kuvan above 20mg/kg/day have not been evaluated.

Phenylketonuria
PKU is an autosomal recessive disorder caused by a defect in PAH. Kuvan is a synthetic formulation of BH4. BH4 has many roles in the body. One of which is to convert amino acids, such as Phe, to precursors of serotonin and dopamine via PAH. The lack of BH4 could result in PKU from HPA. This buildup could lead to severe brain damage, behavioral abnormalities, mental retardation, speech impediments, etc. Kuvan works in the body to supplement the BH4, which in turn helps to convert Phe via PAH appropriately and therefore lowers the levels of Phe in the blood.

FDA or Other Governmental Regulatory Approval
U.S. Food and Drug Administration (FDA)
In December 2007, the U.S. FDA granted marketing approval for Kuvan (sapropterin dihydrochloride) tablets, the first specific drug therapy approved to reduce blood Phe levels in patients with HPA due to BH4-responsive PKU.

Rationale/Source
This medical policy was developed through consideration of peer-reviewed medical literature generally recognized by the relevant medical community, U.S. FDA approval status, nationally accepted standards of medical practice and accepted standards of medical practice in this community, Blue Cross and Blue Shield Association technology assessment program (TEC) and other non-affiliated technology evaluation centers, reference to federal regulations, other plan medical policies, and accredited national guidelines.

Kuvan was studied in four clinical trials. Study 1 was a multicenter, open-label, uncontrolled clinical trial of 489 patients with PKU, ages 8 to 48 years (mean 22 years), who had baseline blood Phe levels ≥450 μmol/L and who were not on Phe-restricted diets. All patients received treatment with Kuvan 10mg/kg/day for 8 days. For the purposes of this study, response to Kuvan treatment was defined as a ≥30% decrease in blood Phe from baseline. At Day 8, 96 patients (20%) were identified as responders.

Study 2 was a multicenter, double-blind, placebo-controlled study of 88 patients with PKU who responded to Kuvan in Study 1. After a washout period from Study 1, patients were randomized equally to either Kuvan 10mg/kg/day (N=41) or placebo (N=47) for 6 weeks. Efficacy was assessed by the mean change in blood Phe level from baseline to Week 6 in the Kuvan-treated group as compared to the mean change in the placebo group. The results showed that at baseline, the mean standard deviation (±SD) blood Phe level was 843 (±300) μmol/L in the Kuvan-treated group and 888 (±323) μmol/L in the placebo group. At Week 6, the Kuvan-treated group had a mean (±SD) blood Phe level of 607 (±377) μmol/L, and the placebo group had a mean blood Phe level of 891 (±348) μmol/L. At Week 6, the Kuvan- and placebo-treated groups had mean changes in blood Phe level of –239 and 6 μmol/L, respectively (mean percent changes of –29% (±32) and 3% (±33), respectively). The difference between the groups was statistically significant (p<0.001).

Study 3 was a multicenter, open-label, extension study in which 80 patients who responded to Kuvan treatment in Study 1 and completed Study 2 underwent 6 weeks of forced dose-titration with 3 different doses of Kuvan. Treatments consisted of 3 consecutive 2-week courses of Kuvan at doses of 5, then 20, and then 10 mg/kg/day. Blood Phe level was monitored after 2 weeks of treatment at each dose level. At baseline, mean (±SD) blood Phe was 844 (±398) μmol/L. At the end of treatment with 5, 10, and 20
mg/kg/day, mean (±SD) blood Phe levels were 744 (±384) μmol/L, 640 (±382) μmol/L, and 581 (±399) μmol/L, respectively.

Study 4 was a multicenter study of 90 children with PKU, ages 4 to 12 years, who were on Phe-restricted diets and who had blood Phe levels ≤480μmol/L at screening. All patients were treated with open-label Kuvan 20 mg/kg/day for 8 days. Response to Kuvan was defined as a ≥30% decrease in blood Phe from baseline at Day 8. At Day 8, 50 patients (56%) had a ≥30% decrease in blood Phe.

References
2. Drugs at FDA. Sapropterin (Kuvan).
**Medically Necessary (or “Medical Necessity”)** - Health care services, treatment, procedures, equipment, drugs, devices, items or supplies that a Provider, exercising prudent clinical judgment, would provide to a patient for the purpose of preventing, evaluating, diagnosing or treating an illness, injury, disease or its symptoms, and that are:

A. In accordance with nationally accepted standards of medical practice;
B. Clinically appropriate, in terms of type, frequency, extent, level of care, site and duration, and considered effective for the patient's illness, injury or disease; and
C. Not primarily for the personal comfort or convenience of the patient, physician or other health care provider, and not more costly than an alternative service or sequence of services at least as likely to produce equivalent therapeutic or diagnostic results as to the diagnosis or treatment of that patient's illness, injury or disease.

For these purposes, “nationally accepted standards of medical practice” means standards that are based on credible scientific evidence published in peer-reviewed medical literature generally recognized by the relevant medical community, Physician Specialty Society recommendations and the views of Physicians practicing in relevant clinical areas and any other relevant factors.
