Intense Pulsed Light Therapy

Policy # 00167

Original Effective Date: 05/23/2005

Current Effective Date: 10/12/2020

Applies to all products administered or underwritten by Blue Cross and Blue Shield of Louisiana and its subsidiary, HMO Louisiana, Inc. (collectively referred to as the "Company"), unless otherwise provided in the applicable contract. Medical technology is constantly evolving, and we reserve the right to review and update Medical Policy periodically.

Note: This medical policy does not apply to pulsed dye laser treatment.

When Services Are Considered Investigational

Coverage is not available for investigational medical treatments or procedures, drugs, devices or biological products.

Based on review of available data, the Company has determined that the use of intense pulsed light (IPL) therapy to treat rosacea or lesions of the vascular system is **investigational**.*

When Services Are Not Covered

Based on review of available data, the Company has determined that the use of intense pulsed light (IPL) therapy to treat conditions of small veins or for the removal of hair is **not eligible for coverage****.

Treatment of telangiectasia, spider veins or other small vein conditions and hair removal is determined to be cosmetic in nature and therefore excluded from coverage under most member contracts.

IPL sources are filtered xenon flashlamps that release pulses of noncoherent polychromatic light. They are less powerful than lasers. Light emitted from IPL devices usually falls in the visible to near infrared range (400 to 1200 nm). The broad range of emitted light makes IPL sources versatile devices, allowing for treatment of both vascular and pigmented lesions. The primary use of IPL devices is for photo rejuvenation. Because the delivered light energy is spread over a broad range of wavelengths, a greater number of treatment sessions is usually required for treatment with an IPL device than for treatment with lasers. Pulse durations are similar to the pulsed lasers.

IPL is similar to laser technology, but the devices produce a broad spectrum of light (wavelengths) with computer-controlled parameters of energy to target specific tissue components of the skin. In

Current Effective Date: 10/12/2020

the case of lesions of the vascular system, such as spider veins of the face or legs, vascular birthmarks, small varicose veins, prominent facial and neck veins, and blood vessel lesions of the trunk, the target tissue is hemoglobin in the blood. A computer is then used to selectively pulse the light source in a specific wavelength range, heating visible blood vessels, while sparing all the surrounding normal skin. This technique controls depth of penetration, and degree of heating, eliminating the need for tedious and potentially painful needle vein sclerosis, and eliminating the need for electric spark cautery which can leave scars. This technique is effective for most patients, but must not be used in patients with recently tanned skin, or those with darker complexions, due to cross-reactivity with the skin's natural melanin pigment.

Pulsed light sources used for the removal of hair use the conversion of light into heat as it passes through the skin and is absorbed in the target pigment melanin found in the hair follicle. When the temperature reaches a high enough level in a hair follicle during its active phase, the targeted hair structures are disabled, thus inhibiting hair re-growth. In clinical trials to date using a number of different lasers and IPL hair removal systems, some test sites remained hair-free for up to two years.

Pulsed light delivery devices differ by level or type of penetration of light energy. PhotoDerm^{TM‡} devices include the PhotoDerm VL (vascular lesions), PhotoDerm PL (pigmented lesions), PhotoDerm HR (hair removal) and PhotoFacial^{TM‡}. Other pulsed light therapy devices identified include; EpiLight^{TM‡}, and Advanced Pulsed Light^{TM‡} (APL).

Rationale/Source

The treatment of small veins and hair removal are considered to cosmetic services. Subscriber contracts often exclude coverage for cosmetic services.

The determination that the use of IPL therapy to treat rosacea or lesions of the vascular system is investigational is based on lack of scientific evidence demonstrating:

- Conclusions concerning the effect of the technology on health outcomes have been addressed;
- The technology improves the net health outcome;
- The technology is at least as beneficial as any established alternatives and improvement is attainable outside the investigational settings.

standard medical practice. Any determination we make that a medical treatment, procedure, drug, device, or biological product is Investigational will be based on a consideration of the following:

- A. Whether the medical treatment, procedure, drug, device, or biological product can be lawfully marketed without approval of the U.S. Food and Drug Administration (FDA) and whether such approval has been granted at the time the medical treatment, procedure, drug, device, or biological product is sought to be furnished; or
- B. Whether the medical treatment, procedure, drug, device, or biological product requires further studies or clinical trials to determine its maximum tolerated dose, toxicity, safety, effectiveness, or effectiveness as compared with the standard means of treatment or diagnosis, must improve health outcomes, according to the consensus of opinion among experts as shown by reliable evidence, including:
 1. Consultation with the Blue Cross and Blue Shield Association technology assessment program (TEC) or other nonaffiliated technology evaluation center(s);
 2. Credible scientific evidence published in peer-reviewed medical literature generally recognized by the relevant medical community; or
 3. Reference to federal regulations.

****Medically Necessary (or “Medical Necessity”)** - Health care services, treatment, procedures, equipment, drugs, devices, items or supplies that a Provider, exercising prudent clinical judgment, would provide to a patient for the purpose of preventing, evaluating, diagnosing or treating an illness, injury, disease or its symptoms, and that are:

- A. In accordance with nationally accepted standards of medical practice;
- B. Clinically appropriate, in terms of type, frequency, extent, level of care, site and duration, and considered effective for the patient's illness, injury or disease; and
- C. Not primarily for the personal comfort or convenience of the patient, physician or other health care provider, and not more costly than an alternative service or sequence of services at least as likely to produce equivalent therapeutic or diagnostic results as to the diagnosis or treatment of that patient's illness, injury or disease.

For these purposes, “nationally accepted standards of medical practice” means standards that are based on credible scientific evidence published in peer-reviewed medical literature generally recognized by the relevant medical community, Physician Specialty Society recommendations and the views of Physicians practicing in relevant clinical areas and any other relevant factors.
